

ALLFUEL®

Magdrive AFM SERIES

Screw Pump

AFM horizontal

AFM vertical

Use

For pumping heating oils, fuels (including low-sulfur ship fuel and marine diesel), lubrication oils, hydraulic oils, or other lubricating liquids and chemicals such as Polyols and isocyanates. The pumped liquids may not contain any abrasive components nor chemically attack the pump material.

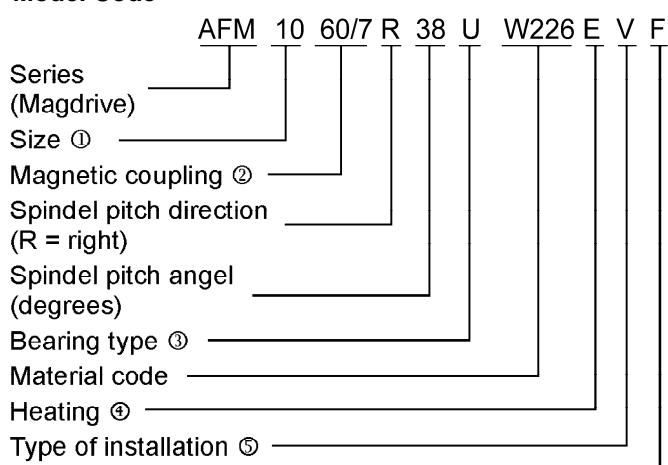

Main fields of application

ALLFUEL Magdrive-(AFM)-pumps are used as transfer, booster, and burner operation pumps in oil-fired systems, as transfer pumps in (marine) fuel systems, as feeder and filling pumps in tank systems, and as lube-oil pumps in virtually all areas of industry. They are also used in plants for production of polyurethanes as a transfer pump based media.

Design

Compact, single pump/motor assembly; vertical and horizontal configuration; without integrated filter.

Model Code

① Theoretical capacity Q [l/min] at 1450 1/min and 46° pitch angle.

② Short designation

60/7

60/14

60/22

- ③ U = internal antifriction bearing.
 ④ A version is available with optional electric heating of the magnetic coupling.
 ⑤ V = vertical; H = horizontal.
 ⑥ F = counter flange; A = adapter flange.

Structural design

Internal-bearing, three-screw, self-priming screw pump with magnetic coupling and without a shaft seal. The magnetic coupling's containment can hermetically seals the pump. Together with the rotor housing, bearing and pump cover, the hardened and polished screws form an insert unit that can be exchanged quickly and easily.

The drive screw is hydraulically balanced. A special screw design absorbs the axial thrust of the idler screws. It is hydraulically driven. Only the torque resulting from liquid friction is transferred over the thread flanks. The thread flanks are therefore virtually free of loads and are not subject to wear. The pumped liquid lubricates all sliding parts and can be categorized as full fluid friction.

The radial and axial bearing of the drive screw is provided by a groove ball bearing.

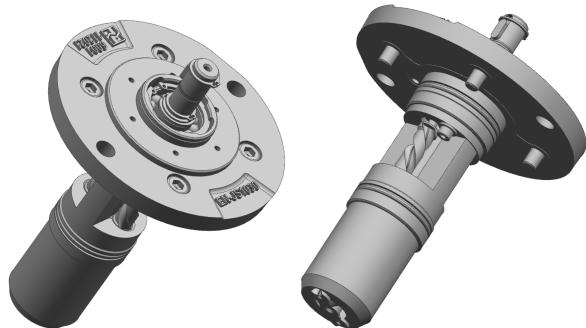

A return bore connects the magnetic coupling and the pump's suction area to each other. This facilitates circulation of the liquid throughout the coupling, thereby forcing heat generated by the eddy current to dissipate out from the coupling.

Three sizes and various screw pitches ensure fine gradation of the entire flow rate range.

The ALLFUEL family is designed with an insert unit consisting of a pre-assembled unit with liner, spindle set, bearing and cover.

In case of changing operation condition which request a different material combination or in case of replacement this insert unit can be implemented quickly and easily without dismantling the pump housing from the pipe works (process design).

The insert unit fits into all existing ALLFUEL pump-housings as well as into pump-housings of the predecessor SPF/M- and SPZ/M-series.

Function

Specially shaped thread flanks cause the three screws to form sealed chambers; rotation of the screws then causes the contents of the chambers to move continuously in the axial direction from the pump's suction side to its pressure side. Despite rotation of the screws, no turbulence results. The uniform chamber volumes eliminate crushing forces.

Performance data

Capacity ①	Q	up to	112 l/min
Inlet pressure	p _s	up to	25 bar
Discharge pressure ②	p _d	up to	40 bar
Temperature of pumped liquid ③	t	up to	150 °C
Viscosity range	v	1 up to	3000 mm ² /s

- ① at n = 2900 1/min and v = 750 mm²/s
 ② Refer to the individual curves for the achievable pump pressure in relation to viscosity and rotational speed. Pressure specifications are applicable only to nearly static pressure loads. Consultation required for dynamically alternating pressure loads.
 ③ Consultation required for higher temperatures.

Filter

A separate system filter is essential when operating these AFM pumps without an integrated filter element. However, these pumps are also available with an integrated radial screen filter (AFM-F version) for protection against contamination. Filter mesh size 0.4 mm. Refer to technical document 488110 for more information. Twin units (version AFM-T) are provided when a reserve pump is required. Refer to technical document 488110 for more information.

Heating

The pumps can be equipped with optional electric heating cartridges for the magnetic coupling.

Pump size	Connection for	Output of heating cartridge (pressure side)
10	230 V	200 W
20	230 V	200 W
40	230 V	300 W

Heating capacity is dimensioned so that when outlet temperature is 20 °C heating time of 60 minutes will be adequate for highly viscous liquid. When temperatures are lower, a correspondingly longer heat-up time will be required. Heating is not designed to achieve noticeably higher liquid temperatures during operation. To avoid potential damage to the bearing, do not exceed the permissible temperature of the pumped liquid.

Flanges and connections

Feed and discharge branches as counter flanges based on SAE (SAE J518C, hole pattern 3000 PSI).

Existing connections: E7 Venting of pump
 H7 Heating cartridge
 M1, M2 Pressure gauge
 Temperature gauge

Noise and pulsation

The design and operation of the screw pump enable a very low noise level and virtually pulsation-free pumping.

Overload protection

A pressure-relief valve is integrated into each pump as a means of overload protection. Its standard trigger pressure is set to approximately 10 % above the working pressure. Please make sure your order specifies if a different trigger pressure is desired.

Installation

To avoid air trapped inside the pump, the pump may not be installed with the flanges pointing down. When installed vertically, a "motor down" arrangement is not permitted for safety reasons. In addition, it is not permissible to install the pump with the vent screw pointing down.

Drive

A motor bracket facilitates connection of a wide variety of electric motors. The following motor type is intended for normal conditions:

Surface-cooled three-phase squirrel-cage motors, IMV 1 design type, IP 55 protection class according to IEC

standard, Insulation Class F utilized according to B, output and main dimensions according to DIN EN 50347.

Motors configured for 50 Hz may also be operated in 60 Hz networks.

Magnetic coupling

The magnetic coupling, located in the pump bracket, provides contactless power transmission between the drive and the pump. Magnetic couplings consist of an outer and an inner drive. Counteracting force fields from the individual permanent magnets act between the two rotating parts. The static containment can provide for hermetic separation. A driveshaft connects the outer drive (outer rotor) directly to the motor. The internal rotor forwards the torque to the pump's drive screw.

Explosion protection

 Fulfillment of requirements according to EU explosion protection directive 2014/34/EU (ATEX 100a) for devices in Device Class II,

Category 2 G. Division into temperature classes according to DIN EN 13463-1 based on the temperature of the pumped liquid. Refer to the quotation/order documentation for the maximum permissible pumped-liquid temperature for each temperature class.

Note: Adequate steps must be taken to prevent impermissible warming of the pump surface when operated in Category 2.

Dimensions in mm,
Direction of rotation:
clockwise, viewed from
drive side

① SAE J518C, hole
pattern 3000 PSI.

② Dimensions are for
reference only and may
deviate depending on
motor manufacturer.

Benefits

► **Versatile and adaptable**

The ability to install the pump horizontally or vertically lets the operator adapt to even small spaces.

► **Economical use of space**

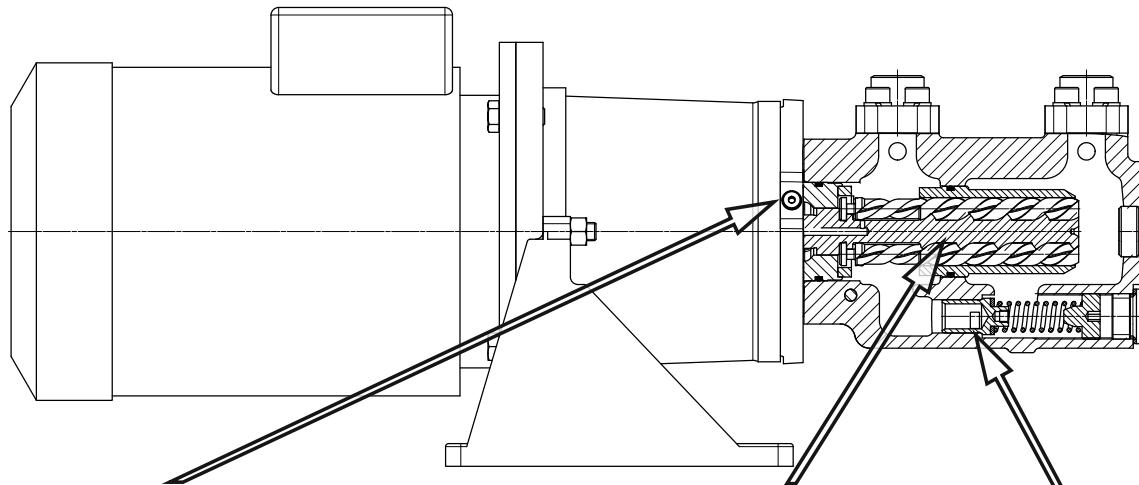

The small size saves space.

► **Extraordinary flexibility**

A wide range of available materials and sizes makes it possible to adapt to special operating conditions and a variety of liquids.

► **Impressive service life**

Hydrodynamic axial thrust compensation minimizes loads on the screws and extends service life.

► **Optimized start-up**

The vent screw ensures the best possible venting of the pump before each start, even when installed vertically.

► **Reliable process stability**

Specially-shaped thread flanks produce virtually pulsation-free, low-noise pumping action.

► **Outstanding operational safety**

The conical valve provides integrated overload protection.

► **“ZERO” leakage**

Contactless transmission of torque with a magnetic coupling eliminates the need to seal rotating parts on the shaft and provides 100% protection against leakage.

► **Extremely durable**

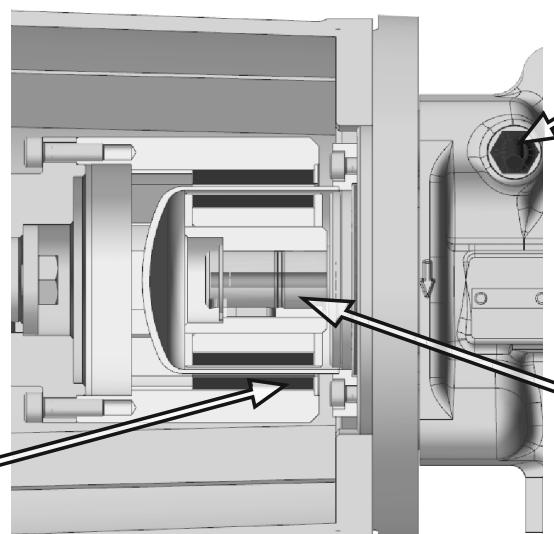

Strong samarium cobalt magnets will not demagnetize under excessive loads and transfer torque smoothly even under very high operating temperatures.

► **Easy pump starting**

The heating cartridge near the containment can prevents the magnetic coupling from disengaging when pumping highly viscous liquids.

► **Automatic cooling**

The return bore in the drive screw ensures effective dissipation of heat and eliminates the need for external cooling.
